Operation Manual

Goodrive300-16

Special Inverter for HVAC

SHENZHEN INVT ELECTRIC CO., LTD.

Preface

Thanks for choosing our products.

Goodrive300-16 special inverters for HVAC are developed according to HVAC application features and control requirements, and can be widely used in heating and water supply.

Applying TI 32bit DSP control system and the most advanced international SVC technology, Goodrive300-16 inverters can meet the high performance requirements of customers. Simultaneously, comparing with the other kinds, Goodrive300-16 inverters can adapt to worse grid, temperature, humidity and dust with a better performance of anti-tripping and improve the reliability. Goodrive300-16 inverters have safe and reliable fault protection function, built-in realtime clock, two groups of PID adjusters and multi-motor combined system and available BACnet communication, etc.

With EMC design, Goodrive300-16 inverters can meet the demand of environmental protection which focuses on low noise and weakening electromagnetic interference in the application sites for the customers.

This manual provides installation and configuration, parameters setting, fault diagnoses and daily maintenance and relative precautions to customers. Please read this manual carefully before the installation to ensure a proper installation and operation and high performance of Goodrive300-16 inverters.

If the product is ultimately used for military affairs or manufacture of weapon, it will be listed on the export control formulated by ***Foreign Trade Law of the People's Republic of China***. Rigorous review and necessary export formalities are needed when exported.

Our company reserves the right to update the information of our products.

Content

Chapter 1 Safety precautions

1.1 What this chapter contains

Please read this manual carefully and follow all safety precautions before moving, installing, operating and servicing the inverter. If ignored, physical injury or death may occur, or damage may occur to the devices.

If any physical injury or death or damage to the devices occurs for ignoring to the safety precautions in the manual, our company will not be responsible for any damages and we are not legally bound in any manner.

1.2 Safety definition

Danger:	Serious physical injury or even death may occur if not follow relevant requirements
Warning:	Physical injury or damage to the devices may occur if not follow relevant requirements
Note:	Physical hurt may occur if not follow relevant requirements
Qualified electricians:	People working on the device should take part in professional electrical and safety training, receive the certification and be familiar with all steps and requirements of installing, commissioning, operating and maintaining the device to avoid any emergency.

1.3 Warning symbols

Warnings caution you about conditions which can result in serious injury or death and/or damage to the equipment, and advice on how to avoid the danger. Following warning symbols are used in this manual:

Symbols	Name	Instruction	Abbreviation
 Danger	Electrical Danger	Serious physical injury or even death may occur if not follow the relative requirements	
 Warning	General danger	Physical injury or damage to the devices may occur if not follow the relative requirements	

Symbols	Name	Instruction	Abbreviation
 Do not	Electrostatic discharge	Damage to the PCBA board may occur if not follow the relative requirements	
 Hot sides	Hot sides	Sides of the device may become hot. Do not touch.	
Note	Note	Physical hurt may occur if not follow the relative requirements	Note

1.4 Safety guidelines

✧Only qualified electricians are allowed to operate on the inverter.

✧Do not carry out any wiring and inspection or changing components when the power supply is applied. Ensure all input power supply is disconnected before wiring and checking and always wait for at least the time designated on the inverter or until the DC bus voltage is less than 36V. Below is the table of the waiting time:

Inverter module		Minimum waiting time
380V	4kW-110kW	5 minutes
380V	132 kW	15 minutes

✧Do not refit the inverter unauthorizedly; otherwise fire, electric shock or other injury may occur.

✧The base of the radiator may become hot during running. Do not touch to avoid hurt.

✧The electrical parts and components inside the inverter are electrostatic. Take measures to avoid electrostatic discharge during relevant operation.

1.4.1 Delivery and installation

✧ Please install the inverter on fire-retardant material and keep the inverter away from combustible materials.

✧ Connect the braking optional parts (braking resistors, braking units or feedback units) according to the wiring diagram.

✧ Do not operate on the inverter if there is any damage or components loss to the inverter.

	✧ Do not touch the inverter with wet items or body, otherwise electric shock may occur.

Note:

- ✧ Select appropriate moving and installing tools to ensure a safe and normal running of the inverter and avoid physical injury or death. For physical safety, the erector should take some mechanical protective measures, such as wearing exposure shoes and working uniforms.
- ✧ Ensure to avoid physical shock or vibration during delivery and installation.
- ✧ Do not carry the inverter by its cover. The cover may fall off.
- ✧ Install away from children and other public places.
- ✧ The inverter cannot meet the requirements of low voltage protection in IEC61800-5-1 if the altitude of installation site is higher than 2000m.
- ✧ Please use the inverter on appropriate condition (See chapter ***Installation Environment***).
- ✧ Do not allow screws, cables and other conductive items to fall inside the inverter.
- ✧ The leakage current of the inverter may be above 3.5mA during operation. High leakage current, earth connection essential before connecting supply. Ground with proper techniques and ensure the grounding resistor is less than 10Ω. The conductivity of PE grounding conductor is the same as that of the phase conductor (with the same cross sectional area).
- ✧ R, S and T are the input terminals of the power supply, while U, V and W are the motor terminals. Please connect the input power cables and motor cables with proper techniques; otherwise the damage to the inverter may occur.

1.4.2 Commission and running

	✧ Disconnect all power supplies applied to the inverter before the terminal wiring and wait for at least the designated time after disconnecting the power supply. ✧ High voltage is present inside the inverter during running. Do not carry out any operation except for the keypad setting. ✧ The inverter may start up by itself when P01.21=1. Do not get close to the inverter and motor. ✧ The inverter can not be used as “Emergency-stop device”. ✧ The inverter can not be used to break the motor suddenly. A mechanical braking device should be provided.

Note:

- ✧ Do not switch on or off the input power supply of the inverter frequently.
- ✧ For inverters that have been stored for a long time, check and fix the capacitance and try to run it again before utilization (see ***Maintenance and Hardware Fault Diagnose***).
- ✧ Cover the front board before running, otherwise electric shock may occur.

1.4.3 Maintenance and replacement of components

	✧ Only qualified electricians are allowed to perform the maintenance, inspection, and components replacement of the inverter. ✧ Disconnect all power supplies to the inverter before the terminal wiring. Wait for at least the time designated on the inverter after disconnection. ✧ Take measures to avoid screws, cables and other conductive matters to fall into the inverter during maintenance and component replacement.

Note:

- ✧ Please select proper torque to tighten screws.
- ✧ Keep the inverter, parts and components away from combustible materials during maintenance and component replacement.
- ✧ Do not carry out any isolation and pressure test on the inverter and do not measure the control circuit of the inverter by megameter.
- ✧ Carry out a sound anti-electrostatic protection to the inverter and its internal components during maintenance and component replacement.

1.4.4 What to do after scrapping

	✧ There are heavy metals in the inverter. Deal with it as industrial effluent.
	✧ When the life cycle ends, the product should enter the recycling system. Dispose of it separately at an appropriate collection point instead of placing it in the normal waste stream.

Chapter 2 Product overview

Goodrive300-16 are special inverters for HVAC designed to solve the application problems in HVAC industry, reduce the costs of customers, enhance the competitiveness and guarantee for the advantages in HVAC industry. The products possess following features:

1. Built-in realtime clock for setting multiple events;
2. Built-in two groups of PID adjusters for various feedback sources;
3. Available various communication extension interfaces for customers, such as BACnet, Profibus DP, DeviceNet and CANopen;
4. Extensible special relay extension board, available multi-motor power and variable frequency switching start or power frequency start

2.1 Product specification

Function		Specification
Power input	Input voltage (V)	3PH 380V(-15%)~440V(+10%)
	Input current (A)	Refer to *the rated value*
	Input frequency (Hz)	50Hz/60Hz Allowed range: 47~63Hz
Power output	Output voltage (V)	0~input voltage, error<5%
	Output current (A)	Refer to *the rated value*
	Output power (kW)	Refer to *the rated value*
	Output frequency (Hz)	0~400Hz
Running control feature	Control mode	V/F, sensorless vector control
	Max. output frequency	400Hz
	Adjustable-speed ratio	Open loop vector 1:100
	Speed control accuracy	±0.2% (sensorless vector control)
	Speed fluctuation	± 0.3% (sensorless vector control)
	Torque response	<20ms (sensorless vector control)
	Torque control accuracy	Open loop vector 10%

Function		Specification
	PID function	2 sets of PID
	Overload capability	G type: 150% of rated current: 60 seconds 180% of rated current: 10 seconds 200% of rated current: 1 second P type: 120% of rated current: 60 seconds
	Starting torque	0.3Hz 150% (sensorless vector control)
	Protection function	More than 30 protection functions, including overvoltage, overcurrent, overheating and phase loss
Peripheral interface	Analog input	2 0~10V/0~20mA and 1 -10~10V
	Analog output	2 0~10V/0~20mA
	Digital input	8 common inputs, the Max. frequency: 1kHz, selectable PNP/NPN 1 high speed input, the Max. frequency: 50kHz
	Digital output	2 programmable relay outputs, NO and NC; 1 high speed pulse output
	Communication	Standard 485 interface, available RTU protocol
	Communication extension interface	Available Profibus DP, DeviceNet, BACnet and CANopen
	Relay extension card	6 programmable relay outputs, NO
Others	Mountable method	Wall and flange mountable
	Temperature of the running environment	-25~55℃, derate above 40℃, If temperature is above 40℃, derate 1% for every additional 1℃.
	Average non-fault time	2 years (25℃ ambient temperature)
	Protective degree	IP20
	Pollution degree	Degree 2
	Safety	Meet CE requirements
	Cooling	Forced air-cooling
	DC reactor	Unavailable for 30kW and below, available for 37kW above
	EMC filter	The whole series of 380V inverters can meet the

Function		Specification
		requirements of level C3 stipulated in IEC61800-3. C2 filters that meet the requirements of level C2 stipulated in IEC61800-3 are optional.

2.2 Name plate

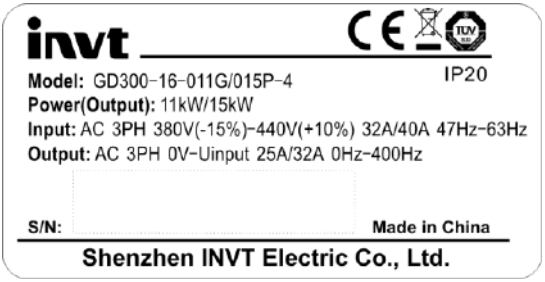

Fig 2-1 Name plate

Note: The name plate above is an example of Goodrive300-16 standard products. CE/TUV/IP20 will be identified on basis of actual certification.

2.3 Type designation key

The type designation contains information on the inverter. The user can find the type designation on the type designation label attached to the inverter or the simple name plate.

GD300-16–5R5G/7R5P – 4 1– HVAC

① ② ③ ④ ⑤

Fig 2-2 Product type

Key	No.	Detailed description	Detailed content
Abbreviation	①	Product abbreviation	GD300-16 is short for Goodrive300-16: special for HVAC
Rated power	②	Power range + Load type	5R5-5.5kW G—Constant torque load P—Variable torque load

Voltage degree	③	Voltage degree	S2: AC 1PH 220V(-15%)~240V(+10%) 2: AC 3PH 220V(-15%)~240V(+10%) 4: AC 3PH 380V(-15%)~440V(+10%) 6: AC 3PH 520V(-15%)~690V(+10%)

GD300-16-075G/090P-4	75/90	160/190	150/180
GD300-16-090G/110P-4	90/110	190/225	180/215
GD300-16-110G/132P-4	110/132	225/265	215/260
GD300-16-132G/160P-4	132/160	265/310	260/305

Note:

1. The input current of inverters 4~132kW is detected when the input voltage is 380V and there is no DC reactors and input/output reactors.
2. The rated output current is defined when the output voltage is 380V.
3. The output current can not exceed the rated output current and the output power can not exceed the rated output power in the voltage range.

Chapter 3 Commissioning guidelines

3.1 Wiring of main circuit

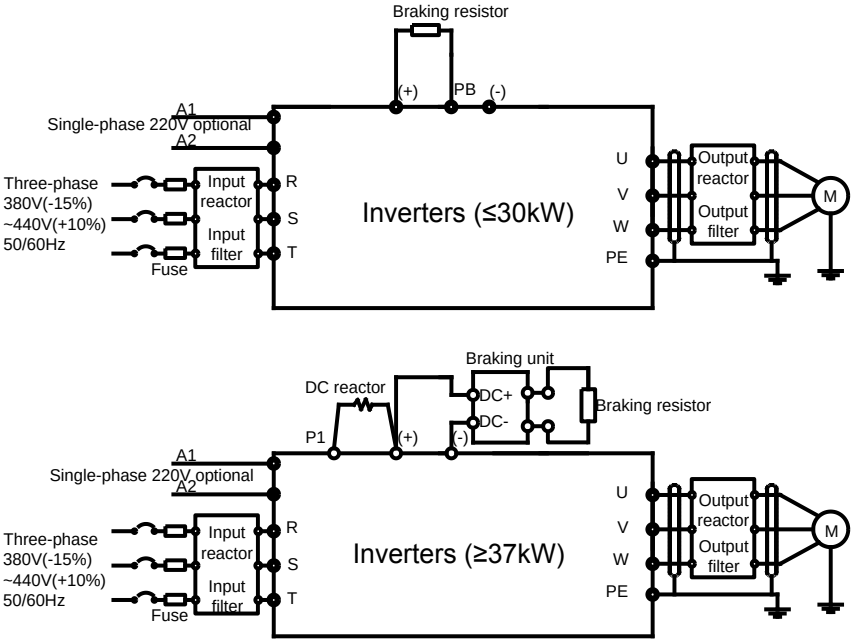

Fig 3-1 Wiring of main circuit

Terminal	Terminal name		Function
	≤75kW	≥90kW	
R,S,T	Power input of the main circuit		3-phase AC input terminals which are generally connected with the power supply.
U,V,W	The inverter output		3-phase AC output terminals which are generally connected with the motor.
P1	/	DC reactor terminal 1	P1 and (+) are connected with the terminals of DC reactor.
(+)	Braking resistor 1	DC reactor terminal 2, braking	(+) and (-) are connected with the terminals of braking unit.

Terminal	Terminal name		Function
	≤75kW	≥90kW	
		unit terminal 1	PB and (+) are connected with the terminals of braking resistor.
(-)	/	Braking unit terminal 2	
PB	Braking resistor 2	/	
PE	380V: the grounding resistor is less than 10Ω		Protective grounding terminals, every machine is provided 2 PE terminals as the standard configuration. These terminals should be grounded with proper techniques.

3.2 Terminals of control circuit

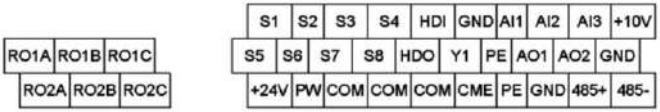

Fig 3-2 Terminals of control circuit

R03A	R03C	R04A	R04C	R05A	R05C	
	R06A	R06C	R07A	R07C	R08A	R08C

Fig 3-3 Relay extension board

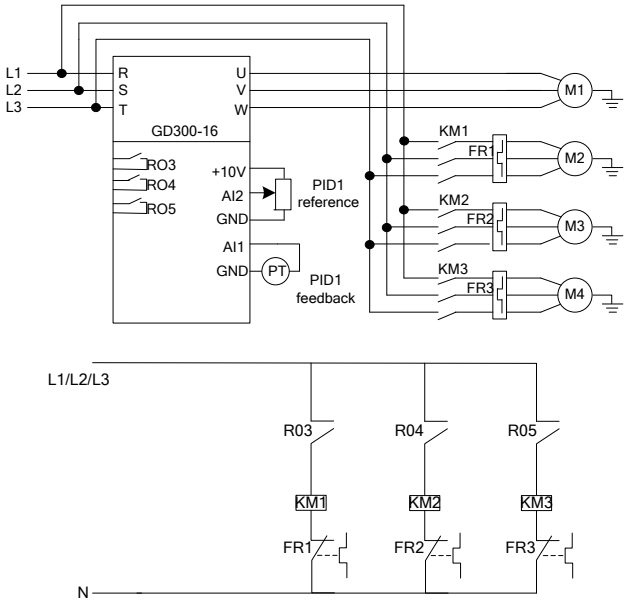
Type	Code	Terminal name	Description
Power supply	+10V	10V reference power supply	The inverter provides 10V reference power supply with a maximum output current of 50mA. Generally as the power supply of the external potentiometer with resistance above 5kΩ
	+24V	24V power supply	The inverter provides 24V±10% power supply with a maximum output current of 200mA. Generally as the working power supply of switch input and output or the external sensor

Type	Code	Terminal name	Description
	PW	External power supply	Provide the input switch working power supply from external to internal. Voltage range: 12~24V
Analog input and output	AI1	Analog input 1	1. Input range: AI1/AI2 voltage and current can be chosen 0~10V/0~20mA; AI3:-10V~+10V 2. Input impedance: voltage input: 20kΩ; current input: 500Ω 3. The voltage or current input is set by the jumper 4. Resolution: the minimum one is 5mV when 10V corresponds to 50Hz
	AI2	Analog input 2	
	AI3	Analog input 3	
	AO1	Analog output 1	1. Output range: 0~10V or 0~20mA 2. The voltage or the current output is set by the jumper 3. Resolution 10bit
	AO2	Analog output 2	
Switch input and output	S1	Switch input 1	1. Internal impedance: 3.3kΩ 2. 12~30V voltage input is available 3. The terminal is the dual-direction input terminal 4. Max. input frequency: 1kHz
	S2	Switch input 2	
	S3	Switch input 3	
	S4	Switch input 4	
	S5	Switch input 5	
	S6	Switch input 6	
	S7	Switch input 7	
	S8	Switch input 8	
	HDI	Switch input	Except for S1~S8, this terminal can be used as high frequency input channel. Max. input frequency: 50kHz
	HDO	Switch output	1. Switch capacity: 50mA/30V

Type	Code	Terminal name	Description
			2. Output frequency range: 0~50kHz
	Y1	Switch output	1. Switch capacity: 50mA/30V 2. Output frequency range: 0~1kHz
Communication	485+,485-	485 communication	485 communication terminal, adopt MODBUS protocol
Relay output	RO1A	Relay 1 NO contact	Contact capacity: 3A/AC250V, 1A/DC30V
	RO1B	Relay 1 NC contact	
	RO1C	Relay 1 common contact	
	RO2A	Relay 2 NO contact	
	RO2B	Relay 2 NC contact	
	RO2C	Relay 2 common contact	
Relay output (relay extension board)	RO3A	Relay 3 NO contact	Contact capacity: 3A/AC250V, 1A/DC30V
	RO3C	Relay 3 common contact	
	RO4A	Relay 4 NO contact	
	RO4C	Relay 4 common contact	
	RO5A	Relay 5 NO contact	
	RO5C	Relay 5 common contact	
	RO6A	Relay 6 NO contact	
	RO6C	Relay 6 common contact	
	RO7A	Relay 7 NO contact	
	RO7C	Relay 7 common contact	
	RO8A	Relay 8 NO contact	
	RO8C	Relay 8 common contact	

3.3 Wiring and commissioning of single fixed variable frequency motor+multiple power frequency motors

3.3.1 Standard wiring diagram



Note: The diagram is the system of the fixed variable frequency motor+3 power frequency motors, which will become the system of single variable frequency motor without connecting power frequency motors. Goodrive300-16 inverter can form the system of the fixed variable frequency motor+8 power frequency motors.

3.3.2 Commissioning steps of basic functions

1. Check the circuits and ensure proper wiring;
2. P00.18=1, restore to factory default;
3. Input the parameters of motor name plate to P2 group and do motor autotuning;
4. P22.00=1, enable HVAC function;
5. P22.10=0, enable fixed variable frequency motor;
6. According to the actual situations, set multiple function codes of P22.11~P22.18 to 2 and enable multiple power frequency motors;
7. According to the motor number, such as A and B, set P06 group;
8. Proper running and commissioning

3.3.3 List of control parameters

List of relevant function parameters (take 3 power frequency motors for example)

Function code	Name	Set value	Remark
P00.00	Speed control mode	2	V/F control
P00.01	Run command channel	1	Terminal control, adjustable according to the actual situations
P00.03	Max. output frequency	50.00Hz	Adjustable according to the actual situations
P00.04	Upper limit of running frequency	50.00Hz	Adjustable according to the actual situations
P00.05	Lower limit of running frequency	20.00Hz	Adjustable according to the actual situations
P00.11	ACC time 1	4.0s	Adjustable according to the actual situations
P00.12	DEC time 1	4.0s	Adjustable according to the actual situations
P05.01	S1 terminals function	1	Forward running
P05.02	S2 terminals function	7	Fault reset
P06.03	Relay RO1 output	01	In running
P06.04	Relay RO2 output	05	Fault output signal
P06.05	Relay RO3 output	35	Connect motor A power frequency
P06.06	Relay RO4 output	37	Connect motor B power frequency
P06.07	Relay RO5 output	39	Connect motor C power frequency
P09.02	Max. PID1 reference	1.000	Adjustable according to the actual situations
P09.03	Upper limit of PID1 reference	1.000	Adjustable according to the actual situations
P09.04	Lower limit of PID1 reference	0.100	Adjustable according to the actual situations
P09.05	PID1 reference source 1	2	Adjustable according to the actual situations
P09.09	ACC/DEC time of	0.000	Adjustable according to the actual

Function code	Name	Set value	Remark
	PID1 reference		situations
P09.10	PID1 feedback source 1	1	Adjustable according to the actual situations
P09.16	Output feature	0	Adjustable according to the actual situations
P09.17	Proportional gain	1.00	Adjustable according to the actual situations
P09.18	Integral time	0.10	Adjustable according to the actual situations
P09.19	Differential time	0.00	Adjustable according to the actual situations
P22.00	HVAC function	1	HVAC function enabled
P22.01	Hibernation type	1	Hibernate according to the running frequency
P22.02	Hibernation starting frequency	40.00Hz	Allow hibernation only when the running frequency is smaller than the value and the hold time is larger than P22.04.
P22.03	Hibernation starting deviation	5.0%	Relative to the maximum PID1 value
P22.04	Hibernation entry delay time	60.0s	Allow hibernation only when the output feature is positive, feedback is larger than reference, the absolute value of the actual deviation is larger than the value and the hold time is larger than P22.04. Allow hibernation only when the output feature is negative, feedback is smaller than reference, the absolute value of the actual deviation is larger than the value and the hold time is larger than P22.04.
P22.05	PID1 reference boost	10.0%	Relative to PID1 reference
P22.06	Max. boost time	10.000s	Used to avoid the case where the inverter

Function code	Name	Set value	Remark
			runs continuously when the running frequency reaches the upper limit while the feedback cannot reach the set value after boost, the inverter will enter hibernation immediately after boost time.
P22.07	Hibernation waking frequency	20.00Hz	PID output directly starts superposition from the frequency when waking up in close loop.
P22.08	Hibernation waking deviation	2.0%	Relative to the maximum PID1 value Allow waking up only when the output feature is positive, feedback is smaller than reference, the absolute value of the actual deviation is larger than the value and the hold time is larger than P22.09. Allow waking up only when the output feature is negative, feedback is larger than reference, the absolute value of the actual deviation is larger than the value and the hold time is larger than P22.09.
P22.09	Hibernation waking delay time	2.0s	Min. hibernation time
P22.10	Variable frequency motor operation	0	Set to the fixed variable frequency motor, invalid when A~H motors are set to variable frequency motor, set to power frequency motors when using multiple motors
P22.11	A motor type	2	Power frequency motor
P22.12	B motor type	2	Power frequency motor
P22.13	C motor type	2	Power frequency motor
P22.19	Pressure allowance when adding motor	4.0%	Adjustable according to the actual situations

Function code	Name	Set value	Remark
P22.20	Running frequency when adding motor	50.00Hz	Adjustable according to the actual situations
P22.21	Delay time when adding motor	10.0s	Adjustable according to the actual situations
P22.24	Pressure allowance when reducing motor	4.0%	Adjustable according to the actual situations
P22.25	Running frequency when reducing motor	25.00Hz	Adjustable according to the actual situations
P22.26	Delay time when reducing motor	5.0s	Adjustable according to the actual situations
P22.27	Action of variable frequency motor when reducing motor	0	Adjustable according to the actual situations
P22.28	ACC time of variable frequency motor when reducing motor	10.0s	Adjustable according to the actual situations
P22.29	Multi-motor pressure loss compensation	0	Adjustable according to the actual situations
P22.30	Pressure reference boost value of 1 auxiliary motor	5.0%	Adjustable according to the actual situations
P22.31	Pressure reference boost value of 2 auxiliary motors	10.0%	Adjustable according to the actual situations
P22.32	Pressure reference boost value of 3 auxiliary motors	15.0%	Adjustable according to the actual situations
P22.33	Circulation cycle of power frequency motor	24.0h	Adjustable according to the actual situations

3.3.4 Instruction of commissioning process

1. If the system of single variable frequency motor does not need the auxiliary power frequency motor, set P22.11, P22.12 and P22.13 to 0. The system will proceed with close loop PID adjustment, control the output frequency of the inverter and support P22.01 to hibernate and wake up.

2. For the system of single variable frequency motor+multiple auxiliary power frequency motors, set the parameters as above table and part of the parameters such as PID1 reference according to the actual situations. For the system of multi-motor in operation at the same time, PID1 feedback detection value may be decreasing, then set P22.29=1 to boost PID1 reference.

3. Generally, set P00.05 to non-zero and need to adjust the value according to the actual situations. In the ACC/DEC stage, when the inverter has no fault, suggest setting P00.11 and P00.12 to smaller values such as in 3~5s to ensure PID adjustment has quick response.

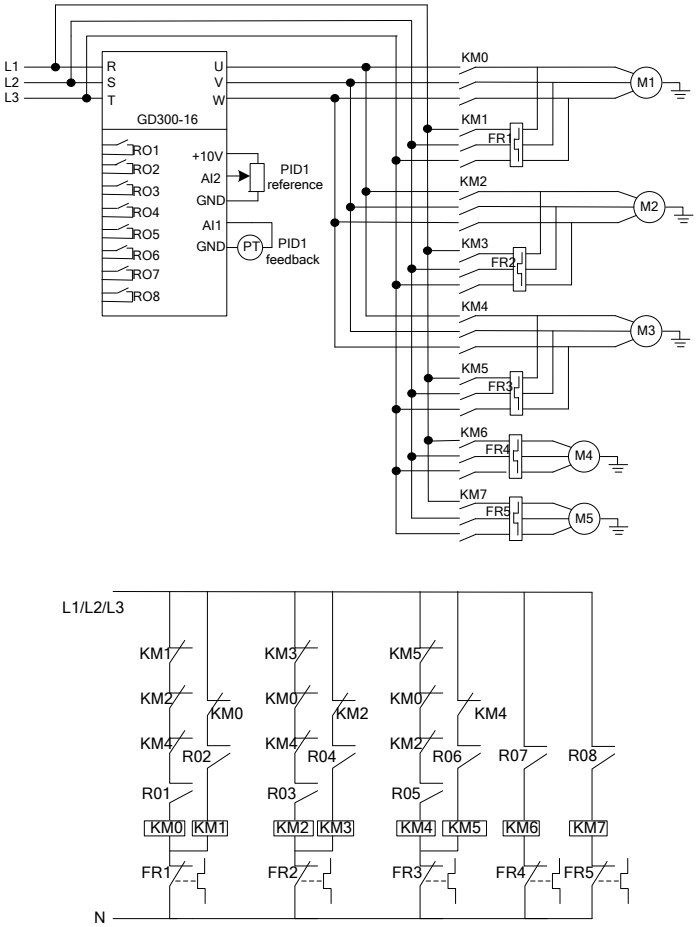
4. P09.17 and P09.18 can be fine-tuned on the basis of factory values. If the actual controlled quantity is over-tuned, set P09.19 properly and adjust according to the actual situations.

5. The system of single variable frequency motor+multiple auxiliary power frequency motors has logic functions of adding and reducing power frequency motors. Please refer to Goodrive300-16 special function codes.

6. The system of single variable frequency motor+multiple auxiliary power frequency motors supports P22.01 to hibernate and wake up only when the system reduces all power frequency motors and the single variable frequency motor runs.

3.4 Wiring and commissioning of multiple circulation variable frequency motors+multiple power frequency motors

3.4.1 Standard wiring diagram



Note: The diagram is the system of 3 circulation variable frequency motors+2 power frequency motors, which will become the system of 3 circulation variable frequency motors without connecting power frequency motors. Goodrive300-16 inverter can form the system of 4 circulation variable frequency motors.

3.4.2 Commissioning steps of basic functions

1. Check the circuits and ensure proper wiring;
2. P00.18=1, restore to factory default;
3. Input the parameters of motor name plate to P2 group and do motor autotuning;
4. P22.00=1, enable HVAC function;
5. P22.10=1, enable circulation variable frequency motor;
6. According to the actual situations, set multiple function codes of P22.11~P22.18 to 1 and enable multiple circulation variable frequency motors; set the function codes to 2 and enable power frequency motors;
7. According to the motor number, such as A and B, set P06 group;
8. Proper running and commissioning

3.4.3 List of control parameters

List of relevant function parameters (take 3 circulation variable frequency motors+2 power frequency motors for example)

Function code	Name	Set value	Remark
P00.00	Speed control mode	2	V/F control
P00.01	Run command channel	1	Terminal control, adjustable according to the actual situations
P00.03	Max. output frequency	50.00Hz	Adjustable according to the actual situations
P00.04	Upper limit of running frequency	50.00Hz	Adjustable according to the actual situations
P00.05	Lower limit of running frequency	20.00Hz	Adjustable according to the actual situations
P00.11	ACC time 1	4.0s	Adjustable according to the actual situations
P00.12	DEC time 1	4.0s	Adjustable according to the actual situations
P05.01	S1 terminals function	1	Forward running
P05.02	S2 terminals function	7	Fault reset
P06.03	Relay RO1 output	34	Connect motor A variable frequency
P06.04	Relay RO2 output	35	Connect motor A power frequency

Function code	Name	Set value	Remark
P06.05	Relay RO3 output	36	Connect motor B variable frequency
P06.06	Relay RO4 output	37	Connect motor B power frequency
P06.07	Relay RO5 output	38	Connect motor C variable frequency
P06.08	Relay RO6 output	39	Connect motor C power frequency
P06.09	Relay RO7 output	41	Connect motor D power frequency
P06.10	Relay RO8 output	43	Connect motor E power frequency
P09.02	Max. PID1 reference	1.000	Adjustable according to the actual situations
P09.03	Upper limit of PID1 reference	1.000	Adjustable according to the actual situations
P09.04	Lower limit of PID1 reference	0.100	Adjustable according to the actual situations
P09.05	PID1 reference source 1	2	Adjustable according to the actual situations
P09.09	ACC/DEC time of PID1 reference	0.000	Adjustable according to the actual situations
P09.10	PID1 feedback source 1	1	Adjustable according to the actual situations
P09.16	Output feature	0	Adjustable according to the actual situations
P09.17	Proportional gain	1.00	Adjustable according to the actual situations
P09.18	Integral time	0.10	Adjustable according to the actual situations
P09.19	Differential time	0.00	Adjustable according to the actual situations
P22.00	HVAC function	1	HVAC function enabled
P22.01	Hibernation type	1	Hibernate according to the running frequency
P22.02	Hibernation starting frequency	40.00Hz	Allow hibernation only when the running frequency is smaller than the value and

Function code	Name	Set value	Remark
			the hold time is larger than P22.04.
P22.03	Hibernation starting deviation	5.0%	Relative to the maximum PID1 value Allow hibernation only when the output feature is positive, feedback is larger than reference, the absolute value of the actual deviation is larger than the value and the hold time is larger than P22.04. Allow hibernation only when the output feature is negative, feedback is smaller than reference, the absolute value of the actual deviation is larger than the value and the hold time is larger than P22.04.
P22.04	Hibernation entry delay time	60.0s	
P22.05	PID1 reference boost	10.0%	Relative to PID1 reference
P22.06	Max. boost time	10.000s	Used to avoid the case where the inverter runs continuously when the running frequency reaches the upper limit while the feedback cannot reach the set value after boost, the inverter will enter hibernation immediately after boost time.
P22.07	Hibernation waking frequency	20.00Hz	PID output directly starts superposition from the frequency when waking up in close loop.
P22.08	Hibernation waking deviation	2.0%	Relative to the maximum PID1 value Allow waking up only when the output feature is positive, feedback is smaller than reference, the absolute value of the actual deviation is larger than the value and the hold time is larger than P22.09. Allow waking up only when the output feature is negative, feedback is larger than reference, the absolute value of the

Function code	Name	Set value	Remark
			actual deviation is larger than the value and the hold time is larger than P22.09.
P22.09	Hibernation waking delay time	2.0s	Min. hibernation time
P22.10	Variable frequency motor operation	1	Circulation variable frequency motor
P22.11	A motor type	1	Variable frequency motor
P22.12	B motor type	1	Variable frequency motor
P22.13	C motor type	1	Variable frequency motor
P22.14	D motor type	2	Power frequency motor
P22.15	E motor type	2	Power frequency motor
P22.19	Pressure allowance when adding motor	4.0%	Adjustable according to the actual situations
P22.20	Running frequency when adding motor	50.00Hz	Adjustable according to the actual situations
P22.21	Delay time when adding motor	10.0s	Adjustable according to the actual situations
P22.22	Switch frequency when adding variable frequency motor	50.00Hz	Adjustable according to the actual situations
P22.23	DEC time of variable frequency motor when adding power frequency motor	10.0s	Adjustable according to the actual situations
P22.24	Pressure allowance when reducing motor	4.0%	Adjustable according to the actual situations
P22.25	Running frequency when reducing motor	25.00Hz	Adjustable according to the actual situations
P22.26	Delay time when reducing motor	5.0s	Adjustable according to the actual situations

Function code	Name	Set value	Remark
P22.27	Action of variable frequency motor when reducing motor	0	Adjustable according to the actual situations
P22.28	ACC time of variable frequency motor when reducing motor	10.0s	Adjustable according to the actual situations
P22.29	Multi-motor pressure loss compensation	0	Adjustable according to the actual situations
P22.30	Pressure reference boost value of 1 auxiliary motor	5.0%	Adjustable according to the actual situations
P22.31	Pressure reference boost value of 2 auxiliary motors	10.0%	Adjustable according to the actual situations
P22.32	Pressure reference boost value of 3 auxiliary motors	15.0%	Adjustable according to the actual situations
P22.33	Circulation cycle of power frequency motor	0.0h	Adjustable according to the actual situations
P22.34	Circulation cycle of variable frequency motor	0.0h	Adjustable according to the actual situations
P22.35	Circulation frequency threshold	45.00Hz	Adjustable according to the actual situations

3.4.4 Instruction of commissioning process

1. If the system of multiple circulation variable frequency motors does not need the auxiliary power frequency motor, set P22.14 and P22.15 to 0. For the system of multiple circulation variable frequency motors+multiple auxiliary power frequency motors, set the parameters as above table and part of the parameters such as PID1 reference according to the actual situations. For the system of multi-motor in operation at the same time, PID1 feedback

detection value may be decreasing, then set P22.29=1 to boost PID1 reference.

2. Generally, set P00.05 to non-zero and need to adjust the value according to the actual situations. In the ACC/DEC stage, when the inverter has no fault, suggest setting P00.11 and P00.12 to smaller values such as in 5s to ensure PID adjustment has quick response.

3. P09.17 and P09.18 can be fine-tuned on the basis of factory values. If the actual controlled quantity is over-tuned, set P09.19 properly and adjust according to the actual situations.

4. During adding and reducing motors, add variable frequency motors in priority if meeting the conditions of adding motors; add power frequency motors if no variable frequency motors. When the system of multi-motor in operation at the same time has only one motor in variable frequency while others in power frequency and meets the conditions of reducing motors, reduce power frequency motors until variable frequency motors are left. Please refer to Goodrive300-16 special function codes.

5. The system of multiple circulation variable frequency motors+multiple auxiliary power frequency motors supports P22.01 to hibernate and wake up only when the system reduces all power frequency motors and the single variable frequency motor runs.

3.5 Commissioning instruction of extension functions

1. Realtime clock and timing function: Goodrive300-16 has built-in clock chip. After the time is set to the chip, the current time and date can be observed on the inverter. The timing function can be set according to the realtime time to control automatic start and stop of the inverter. Refer to P21 group in *Appendix A* for detailed information.

2. Fire override function: Once there is any fire signal sent to the inverter, after the program inside the inverter identifies the information, the motors will keep running in the set fire frequency. Goodrive300-16 has 2 fire modes: fire mode 1: the inverter will keep running all the time unless it is damaged; fire mode 2: the inverter will keep running all the time except that it stops at OUT1, OUT2, OUT3, OC1, OC2, OC3, OV1, OV2, OV3 and SPO. Refer to P21 group in *Appendix A* for detailed information.

3. Second set of PID adjustment function: Goodrive300-16 has built-in two sets of PID adjusters. PID2 start or stop can be triggered by switch signals or current actual control detection values. PID2 adjustment output values can be output to other masters via analog or communication modes to control other functions. Refer to P21 group in *Appendix A* for detailed information.

4. Detection function of water level of intake sump: Goodrive300-16 has built-in

detection function of water level of intake sump for water supply applications. The inverter receives the signals of water level of intake sump in real time. If the water level changes from high to low, PID1 reference will be normal set value when the water level above lower limit; PID1 reference will be P22.43 when the water level below lower limit and above water shortage level; all water pumps of the control system will stop when the water level below water shortage level. If the water level changes from low to high, the system will stop when the water level below lower limit; PID1 reference will be P22.43 when the water level below upper limit and above lower limit; PID1 reference will be normal set value when the water level above upper limit.

5. Abnormal PID1 feedback pre-alarm function: Goodrive300-16 has built-in abnormal PID1 feedback detection pre-alarm function. The inverter receives feedback signals in real time. If PID1 feedback is P22.45 and no more than P22.44, the inverter will display “-LP-” indicating PID1 feedback is too low. If PID1 feedback is P22.47 and no less than P22.46, the inverter will display “-HP-” indicating PID1 feedback is too high. Press PRG/ESC key to return to stop or run displaying interface and other keys are invalid. If PID1 feedback is normal, return to stop or run displaying interface automatically.

6. Multi-motor manual start test function: The manual start test function consists of manual soft start and manual circulation.

The manual soft start is only valid for circulation variable frequency motors and needs fitting with the terminal corresponding to the function of the motors. When the manual soft start and the signal of manual soft start of variable frequency motors are valid, the inverter will control the motor to start and run to P22.38, then coast to stop and connect the motor to power frequency power. If the corresponding S terminal of the motor is invalid, stop immediately. If the corresponding terminal of manual soft commissioning command is invalid, all motors will stop immediately.

When the manual circulation signal is valid, the circulation process for power frequency motors: connect the motor to power frequency power supply and disconnect the power supply after running a certain time, repeat with the second valid motor and so on. When the manual circulation signal is valid, the circulation process for variable frequency motors: start operating the motor in switch frequency P22.22, control the inverter to coast to stop after running a certain time, then connect the motor to power frequency power supply and disconnect the power supply after running a certain time, repeat with the second valid motor and so on. All motors under power frequency and variable frequency will stop only when the manual circulation signal is invalid.

7. HVAC check function: The running conditions of the motors, PID1 and PID2 running states and relevant output values can be checked out in P18 group. The function facilitates analyzing and adjusting function parameters.

3.6 Maintenance intervals

If installed in an appropriate environment, the inverter requires very little maintenance. The table lists the routine maintenance intervals recommended by INVT.

Checking		Item	Method	Criterion
Ambient environment		Check the ambient temperature, humidity and vibration and ensure there is no dust, gas, oil fog and water drop.	Visual examination and instrument test	Conforming to the manual
		Ensure there are no tools or other foreign or dangerous objects	Visual examination	There are no tools or dangerous objects.
Voltage		Ensure the main circuit and control circuit are normal.	Measurement by millimeter	Conforming to the manual
Keypad		Ensure the display is clear enough	Visual examination	The characters are displayed normally.
		Ensure the characters are displayed totally	Visual examination	Conforming to the manual
Main circuit	For public use	Ensure the screws are tightened securely	Tighten up	NA
		Ensure there is no distortion, crackles, damage or color-changing caused by overheating and aging to the machine and insulator.	Visual examination	NA
		Ensure there is no dust and dirtiness	Visual examination	NA **Note**: if the color of the copper blocks change, it

Checking		Item	Method	Criterion
				does not mean that there is something wrong with the features.
	The lead of the conductors	Ensure that there is no distortion or color-changing of the conductors caused by overheating.	Visual examination	NA
		Ensure that there are no crackles or color-changing of the protective layers.	Visual examination	NA
	Terminals seat	Ensure that there is no damage	Visual examination	NA
	Filter capacitors	Ensure that there is no weeping, color-changing, crackles and casing expansion.	Visual examination	NA
		Ensure the safety valve is in the right place.	Estimate the usage time according to the maintenance or measure the static capacity.	NA
		If necessary, measure the static capacity.	Measure the capacity by instruments.	The static capacity is above or equal to the original value *0.85.
	Resistors	Ensure whether there is displacement caused by overheating.	Smelling and visual examination	NA
		Ensure that there is no offline.	Visual examination or remove one ending to coagulate	The resistors are in ±10% of the standard value.

Checking		Item	Method	Criterion
			or measure with multimeters	
	Transformers and reactors	Ensure there is no abnormal vibration, noise and smelling,	Hearing, smelling and visual examination	NA
	Electromagnetism contactors and relays	Ensure whether there is vibration noise in the workrooms.	Hearing	NA
		Ensure the contact is good enough.	Visual examination	NA
Control circuit	PCB and plugs	Ensure there are no loose screws and connectors.	Fasten up	NA
		Ensure there is no smelling and color-changing.	Smelling and visual examination	NA
		Ensure there are no crackles, damage, distortion and rust.	Visual examination	NA
		Ensure there is no weeping and distortion to the capacitors.	Visual examination or estimate the usage time according to the maintenance information	NA
Cooling system	Cooling fan	Estimate whether there is abnormal noise and vibration.	Hearing and Visual examination or rotate with hand	Stable rotation
		Estimate there is no loose screw.	Tighten up	NA
		Ensure there is no color-changing caused by overheating.	Visual examination or estimate the usage time	NA

Checking		Item	Method	Criterion
			according to the maintenance information	
	Ventilating duct	Ensure whether there is no stuff or foreign objects in the cooling fan and air vent.	Visual examination	NA

Consult the local service representative for more details on the maintenance. Visit the official website.

3.7 Fault instruction and solution

Do as the following after the inverter fault:

1. Check to ensure there is nothing wrong with the keypad. If not, please contact with the local INVT office.

2. If there is nothing wrong, please check P07 and ensure the corresponding recorded fault parameters to confirm the real state when the current fault occurs by all parameters.

3. See the following table for detailed solution and check the corresponding abnormal state.

4. Eliminate the fault and ask for relative help.

5. Check to eliminate the fault and carry out fault reset to run the inverter.

Code	Fault	Cause	Solution
OUt1	IGBT U phase protection	●The acceleration is too fast ●There is damage to the internal to IGBT of the phase ●The connection of the driving wires is not good ●The grounding is not good	● Increase ACC time ● Change the power unit ● Check the driving wires ● Check if there is strong interference to the external equipment
OUt2	IGBT V phase protection		
OUt3	IGBT W phase protection		
OC1	Accelerating overcurrent	●The acceleration or deceleration is too fast ●The voltage of the grid is too low ●The power of the inverter is too low ●The load transients or is	●Increase the ACC time ●Check the input power ●Select the inverter with a larger power ●Check if the load is short circuited (the grounding short circuited or the wire short
OC2	Decelerating overcurrent		
OC3	Constant overcurrent		

Code	Fault	Cause	Solution
		abnormal ●The grounding is short circuited or the output is phase loss ●There is strong external interference	circuited) or the rotation is not smooth ●Check the output configuration. ●Check if there is strong interference
OV1	Accelerating overvoltage	●The input voltage is abnormal ●There is large energy feedback	●Check the input power ●Check if the DEC time of the load is too short or the inverter starts during the rotation of the motor or it needs to increase the energy consumption components
OV2	Decelerating overvoltage		
OV3	Constant overvoltage		
UV	Bus undervoltage fault	●The voltage of the power supply is too low	●Check the input power of the supply line
OL1	Motor overload	●The voltage of the power supply is too low ●The motor setting rated current is incorrect ●The motor stall or load transients is too strong	●Check the power of the supply line ●Reset the rated current of the motor ●Check the load and adjust the torque lift
OL2	Inverter overload	●The acceleration is too fast ●Reset the rotating motor ●The voltage of the power supply is too low. ●The load is too heavy. ●The motor power is too small.	●Increase the ACC time ●Avoid the restarting after stopping. ●Check the power of the supply line ●Select an inverter with bigger power. ●Select a proper motor.
SPI	Input phase loss	●Phase loss or fluctuation of input R,S,T	●Check input power ●Check installation distribution

Code	Fault	Cause	Solution
SPO	Output phase loss	●U,V,W phase loss input(or serious asymmetrical three phase of the load)	●Check the output distribution ●Check the motor and cable
OH1	Rectifying module overheated	●Air duct jam or fan damage ●Ambient temperature is too high. ●The time of overload running is too long.	●Refer to the overcurrent solution ●Redistribute dredge the wind channel or change the fan ●Low the ambient temperature ●Check and reconnect ●Change the power ●Change the power unit ●Change the main control panel
OH2	IGBT overheated		
EF	External fault	●SI external fault input terminals action	●Check the external device input
CE	485 communication fault	●The baud rate setting is incorrect. ●Fault occurs to the communication wiring. ●The communication address is wrong. ●There is strong interference to the communication.	●Set proper baud rate ●Check the communication connection distribution ●Set proper communication address. ●Chang or replace the connection distribution or improve the anti-interference capability. ●
ItE	Current-detecting fault	●The connection of the control board is not good ●Assistant power is bad ●Hoare components is broken ●The modifying circuit is abnormal.	●Check the connector and repatch ●Change the Hoare Change the main control panel
tE	Motor-autotuning fault	●The motor capacity does not comply with the inverter capability ●The rated parameter of the motor does not set correctly.	●Change the inverter mode ●Set the rated parameter according to the motor name plate ●Empty the motor load and

Code	Fault	Cause	Solution
		●The offset between the parameters from autotune and the standard parameter is huge ●Autotune overtime	reidentify ●Check the motor connection and set the parameter. ●Check if the upper limit frequency is above 2/3 of the rated frequency.
EEP	EEPROM operation fault	●Error of controlling the write and read of the parameters ●Damage to EEPROM	●Press STOP/RST to reset ●Change the main control panel
bCE	Braking unit fault	●Braking circuit fault or damage to the braking pipes ●The external braking resistor is not sufficient	●Check the braking unit and , change new braking pipe ●Increase the braking resistor
END	Running time arrival	●The actual running time of the inverter is above the internal setting running time.	●Ask for the supplier and adjust the setting running time.
OL3	Electrical overload	●The inverter will report overload pre-alarm according to the set value.	●Check the load and the overload pre-alarm point.
PCE	Keypad communication fault	●The connection of the keypad wires is not good or broken. ●The keypad wire is too long and affected by strong interference. ●There is circuit fault on the communication of the keypad and main board.	●Check the keypad wires and ensure whether there is mistake. ●Check the environment and avoid the interference source. ●Change the hardware and ask for service.
UPE	Parameters uploading fault	●The connection of the keypad wires is not good or broken. ●The keypad wire is too long	●Check the keypad wires and ensure whether there is mistake. ●Change the hardware and ask for service.

Code	Fault	Cause	Solution
		and affected by strong interference. ●Communication fault.	●Change the hardware and ask for service.
DNE	Parameters downloading fault	●The connection of the keypad wires is not good or broken. ●The keypad wire is too long and affected by strong interference. ●There is mistake on the data storage of the keypad.	●Check the keypad wires and ensure whether there is mistake. ●Change the hardware and ask for service. ●Repack-up the data in the keypad.
ETH1	Grounding shortcircuit fault 1	●The output of the inverter is short circuited with the ground. ●There is fault in the current detection circuit. ●The actual motor power sharply differs from the inverter power.	●Check if the connection of the motor is normal or not ●Change the hoare ●Change the main control panel ●Set motor parameters correctly.
ETH2	Grounding shortcircuit fault 2	●The output of the inverter is short circuited with the ground. ●There is fault in the current detection circuit. ●The actual motor power sharply differs from the inverter power.	●Check if the connection of the motor is normal or not ●Change the Hoare Change the main control panel ●Set motor parameters correctly.
dEv	Speed deviation fault	●The load is too heavy or stalled.	●Check the load and ensure it is normal. Increase the detection time. ●Check whether the control parameters are normal.
STo	Maladjustment	●The control parameters of	●Check the load and ensure it is

Code	Fault	Cause	Solution
	fault	the synchronous motors not set properly. ●The autotuning parameter is not right. ●The inverter is not connected to the motor.	normal. ●Check whether the control parameter is set properly or not. ●Increase the maladjustment detection time.
LL	Electronic underload fault	●The inverter will report the underload pre-alarm according to the set value.	●Check the load and the underload pre-alarm point.
PId1E	Feedback over limit fault	●PID1 feedback value is larger than upper limit detection value or smaller than lower limit detection value in a long time.	●Check PID1 feedback source; ●Check PID1 feedback source signal connection
TI-E	Clock chip fault	●The slot terminal board is loose. ●EEPROM is broken	●Check the slot terminal board; ●Press STOP/RST to reset; ●Change the main control board
E-DP	Profibus-DP communication fault	●Communication address is not correct. ●Corresponding resistor is not dialed ●The files of main stop GSD does not set sound ●The ambient interference is too strong.	●Check related setting ●Check the communication method selection. ●Check the environment and avoid the interference.
E-NET	Ethernet communication fault	●The Ethernet address is not set right. ●The Ethernet communication is not selected to right. ●The ambient interference is too strong.	●Check the relative setting. ●Check the communication method selection. ●Check the environment and avoid the interference.
E-CAN	CANopen	●The connection is not sound	●Check the connection

Code	Fault	Cause	Solution
	communication fault	●Corresponding resistor is not dialed ●The communication baud rate is uneven ●The ambient interference is too strong.	●Draw out the correspond resistor ●Set the same baud rate ●Check the environment and avoid the interference.
E-DP	BACnet communication fault	● A wrong Ethernet communication mode is selected. ●The ambient interference is too strong.	●Check the communication method selection. ●Check the environment and avoid the interference.
E-CAN	Devicenet communication fault	●The connection is not sound ●The communication baud rate is uneven ●The ambient interference is too strong.	●Check the connection ●Set the same baud rate ●Check the environment and avoid the interference.
HP	Low PID1 feedback pre-alarm Inverter non-stop fault	●PID1 feedback value continues P22.45 and is smaller than P22.44	●Check PID1 actual feedback value is normal ●Check PID1 feedback detection device has no fault
LP	High PID1 feedback pre-alarm Inverter non-stop fault	●PID1 feedback value continues P22.47 and is larger than P22.46	●Check PID1 actual feedback value is normal ●Check PID1 feedback detection device has no fault

Appendix A Function parameters

For the convenience of function codes setting, the function group number corresponds to the first level menu, the function code corresponds to the second level menu and the function code parameter corresponds to the third level menu.

Below is the instruction of the function lists:

The first line “Function code”: codes of function parameter group and parameters;

The second line “Name”: full name of function parameters;

The third line “Detailed instruction of parameters”: detailed instruction of the function parameters;

The fourth line “Default value”: the original factory values of the function parameter;

The fifth line “Modify”: the modifying character of function codes (the parameters can be modified or not and the modifying conditions), below is the instruction:

“○”: means the set value of the parameter can be modified on stop and running state;

“◎”: means the set value of the parameter can not be modified on the running state;

“●”: means the value of the parameter is the real detection value which can not be modified.

(The inverter has limited the automatic inspection of the modifying character of the parameters to help users avoid mismodifying)

A.1 Goodrive300-16 basic function parameters

Function code	Name	Detailed instruction of parameters	Default value	Modify
P00 Group Basic function group				
P00.00	Speed control mode	0: Sensorless vector control mode 0 1: Sensorless vector control mode 1 2: V/F control **Note**: Applicable only to asynchronous motors. Motor parameter autotuning must be performed on the inverter first when the vector mode is used.	2	◎
P00.01	Run command channel	0: Keypad running command 1: Terminal running command channel 2: Communication running command channel	0	○
P00.02	Communication	0: MODBUS communication channel 1: Profibus/CANopen/BACnet/Devicenet	0	○

Function code	Name	Detailed instruction of parameters	Default value	Modify
	running commands	communication channel 2: Ethernet communication channel 3:Reserved **Note**: 1, 2 and 3 are extension functions which need corresponding extension cards.		
P00.03	Max. output frequency	Max. (P00.04, 10.00)~400.00Hz	50.00Hz	◎
P00.04	Upper limit of running frequency	P00.05~P00.03 (Max. output frequency)	50.00Hz	◎
P00.05	Lower limit of running frequency	0.00Hz~P00.04 (Upper limit of running frequency)	0.00Hz	◎
P00.06	A frequency command	0: Keypad 1: AI1 2: AI2 3: AI3 4: High-speed pulse HDI setting 5: Simple PLC program setting 6: Multi-step speed running setting 7: PID1 control setting 8: MODBUS communication setting 9: Profibus/CANopen/BACnet/Devicenet communication setting 10: Ethernet communication setting 11: Reserved	0	○
P00.07	B frequency command		2	○
P00.08	B frequency command reference	0: Maximum output frequency 1: A frequency command	0	○
P00.09	Combination of setting source	0: A 1: B 2: A+B 3: A-B	0	○

Function code	Name	Detailed instruction of parameters	Default value	Modify
		4: Max (A, B) 5: Min (A, B)		
P00.10	Keypad set frequency	0.00 Hz~P00.03 (Max. output frequency)	50.00Hz	○
P00.11	ACC time 1	0.0~3600.0s	Depend on model	○
P00.12	DEC time 1	0.0~3600.0s	Depend on model	○
P00.13	Running direction	0: Runs at the default direction 1: Runs at the reverse direction	0	○
P00.14	Carrier frequency setting	1.0~15.0kHz	Depend on model	○
P00.15	Motor parameter autotuning	0: No operation 1: Rotation autotuning 2: Static autotuning 1(autotune totally) 3: Static autotuning 2(autotune part parameters)	0	◎
P00.16	AVR function selection	0: Invalid 1: Valid during the whole procedure	1	○
P00.17	Inverter type	0: G type 1: P type	0	◎
P00.18	Function restore parameter	0: No operation 1: Restore the default value 2: Cancel the fault record	0	◎
P01 Group Start-up and stop control				
P01.00	Start mode	0: Start-up directly 1: Start-up after DC braking 2: Start-up after speed tracing	0	◎
P01.01	Starting frequency	0.00~50.00Hz	0.50Hz	◎

Function code	Name	Detailed instruction of parameters	Default value	Modify
	of direct start			
P01.02	Retention time of starting frequency	0.0~50.0s	0.0s	◎
P01.03	The braking current before starting	0.0~100.0%	0.0%	◎
P01.04	The braking time before starting	0.00~50.00s	0.00s	◎
P01.05	ACC/DEC selection	0:Linear type	0	◎
P01.08	Stop mode	0: Decelerate to stop 1: Coast to stop	0	○
P01.09	Starting frequency of DC braking	0.00Hz~P00.03 (Max. output frequency)	0.00Hz	○
P01.10	Waiting time of DC braking	0.00~50.00s	0.00s	○
P01.11	DC braking current	0.0~100.0%	0.0%	○
P01.12	DC braking time	0.00~50.00s	0.00s	○
P01.13	Dead time of FWD/REV	0.0~3600.0s	0.0s	○

Function code	Name	Detailed instruction of parameters	Default value	Modify
	rotation			
P01.14	Shifting between FWD/REV rotation	0:Switch after zero frequency 1:Switch after the starting frequency	1	◎
P01.15	Stopping speed	0.00~100.00Hz	0.50Hz	◎
P01.16	Detection of stopping speed	0: Detect according to speed setting (no stopping delay) 1: Detect according to speed feedback (only valid for vector control)	0	◎
P01.17	Detection time of feedback speed	0.00~100.00s (only valid when P01.16=1)	0.50s	◎
P01.18	Terminal running protection when powering on	0: The terminal running command is invalid when powering on 1: The terminal running command is valid when powering on	0	○
P01.19	Action if running frequency< lower limit frequency (valid >0)	0: Run at the lower-limit frequency 1: Stop	0	◎
P01.21	Restart after power off	0: Disable 1: Enable	0	○
P01.22	The waiting	0.0~3600.0s (valid when P01.21=1)	1.0s	○

Function code	Name	Detailed instruction of parameters	Default value	Modify
	time of restart after power off			
P01.23	Start delay time	0.0~60.0s	0.0s	○
P01.24	Delay time of stop speed	0.0~100.0s	0.0s	○
P01.25	0Hz output selection	0: Output without voltage 1: Output with voltage 2: Output at DC braking current at stopping	1	○
P02 Group Motor 1				
P02.01	Rated power of asynchronous motor 1	0.1~3000.0kW	Depend on model	◎
P02.02	Rated frequency of asynchronous motor 1	0.01Hz~P00.03 (Max. output frequency)	50.00Hz	◎
P02.03	Rated speed of asynchronous motor 1	1~36000rpm	Depend on model	◎
P02.04	Rated voltage of asynchronous motor 1	0~1200V	Depend on model	◎
P02.05	Rated current of asynchronous motor 1	0.8~6000.0A	Depend on model	◎

Function code	Name	Detailed instruction of parameters	Default value	Modify
P02.06	Stator resistor of asynchronous motor 1	0.001~65.535Ω	Depend on model	○
P02.07	Rotor resistor of asynchronous motor 1	0.001~65.535Ω	Depend on model	○
P02.08	Leakage inductance of asynchronous motor 1	0.1~6553.5mH	Depend on model	○
P02.09	Mutual inductance of asynchronous motor 1	0.1~6553.5mH	Depend on model	○
P02.10	Non-load current of asynchronous motor 1	0.1~6553.5A	Depend on model	○
P02.11	Magnetic saturation coefficient 1 for the iron core of AM1	0.0~100.0%	80.0%	◎

CANopen communication card	EC-TX-105	
Devicenet communication card	EC-TX-106	
BACnet card	EC-TX-107	

C.1 Breaker and electromagnetic contactor (optional)

It is necessary to add fuse for the avoidance of overload.

It is appropriate to use a breaker (MCCB) which complies with the inverter power in the 3-phase AC power and input power and terminals (R,S,T). The capacity of the inverter should be 1.5-2 times of the rated current.

✧Due to the inherent operating principle and construction of circuit breakers, independent of the manufacturer, hot ionized gases may escape from the breaker enclosure in case of a short-circuit. To ensure safe use, special attention must be paid to the installation and placement of the breakers. Follow the manufacturer's instructions.

It is necessary to install the electromagnetic contactor in the input side to control the switching on and off safety of the main circuit. It can switch off the input power supply when system fault.

Model	Fuse (A)	Breaker (A)	Rated working current of the contactor(A)
GD300-16-004G/5R5P-4	30	25	16
GD300-16-5R5G/7R5P-4	45	25	16
GD300-16-7R5G/011P-4	60	40	25
GD300-16-011G/015P-4	78	63	32
GD300-16-015G/018P-4	105	63	50
GD300-16-018G/022P-4	114	100	63
GD300-16-022G/030P-4	138	100	80
GD300-16-030G/037P-4	186	125	95

Model	Fuse (A)	Breaker (A)	Rated working current of the contactor(A)
GD300-16-037G/045P-4	228	160	120
GD300-16-045G/055P-4	270	200	135
GD300-16-055G/075P-4	315	200	170
GD300-16-075G/090P-4	420	250	230
GD300-16-090G/110P-4	480	315	280
GD300-16-110G/132P-4	630	400	315
GD300-16-132G/160P-4	720	400	380

Note: The specifications can be adjusted according to the actual working, but it can not be less than the designated values.

C.2 Reactors (optional)

Transient high current in the input power circuit may cause damage to the rectifying components. It is appropriate to use AC reactor in the input side for the avoidance of high-voltage input of the power supply and improvement of the power factors.

If the distance between the inverter and the motor is longer than 50m, frequent overcurrent protection may occur to the inverter because of high leakage current caused by parasitic capacitance effects from the long cables to the ground. In order to avoid the damage of the motor insulation, it is necessary to add reactor compensation.

If the distance between the inverter and motor is 50~100m, see the table below for model selection; if it exceeds 100m, consult with INVT technical support.

The inverters of 380V (≥37kW), 500V (≥22kW) and of 660V are equipped with external DC reactors for the improvement of power factors and the avoidance of damage from high input current to the rectifying components because of the high-capacity transformer. The device can also cease the damage to the rectifying components which are caused by supply grid voltage transients and harmonic waves of the loads.

GD300-16-110G/132P-4	ACL2-110-4	DCL2-110-4	OCL2-110-4
GD300-16-132G/160P-4	ACL2-132-4	DCL2-132-4	OCL2-132-4

Note:

1. The rated derate voltage of the input reactor is 2%±15%.
2. The power factor of the input side is above 90% after installing DC reactor.
3. The rated derate voltage of the output reactor is 1%±15%.
4. Above options are external, the customer should indicate when purchasing.

C.3 Filter (optional)

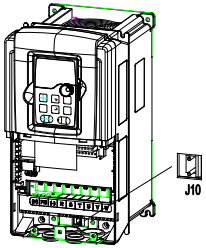
J10 is not connected in factory for inverters of 380V (≤ 110kW). Connect the J10 packaged with the manual if the requirements of level C3 need to be met;

J10 is connected in factory for inverters of 380V (≥ 132kW), all of which meet the requirements of level C3,

Note:

Disconnect J10 in the following situations:

1. The EMC filter is applicable to neutral-grounded grid system. If it is used for IT grid system (that is, non- neutral grounded grid system), disconnect the J10.
2. If leakage protection occurs when configuring the residual-current circuit breaker, disconnect J10**.**



Note: Do not connect C3 filters in IT power system.

The input interference filter can decrease the interference of the inverter to the surrounding equipments.

Output interference filter can decrease the radio noise cause by the cables between the inverter and the motor and the leakage current of the conducting wires.

Our company has provided some filters for users to choose.

C.3.1 Filter type instruction

FLT-P04045L-B

A B C D E F

Character designation	Detailed instruction
A	FLT: inverter filter series
B	Filter type P: power supply filter L: output filter
C	Voltage degree 04: AC 3PH 380V (-15%)~440V(+10%) 06: AC 3PH 520V (-15%)~690V(+10%)
D	3 bit rated current code, “015” means 15A
E	Installation type L: Common type H: High performance type
F	Utilization environment of the filters A: the first environment (IEC61800-3:2004) category C1 (EN

Character designation	Detailed instruction
	61800-3:2004) B: the first environment (IEC61800-3:2004) category C2 (EN 61800-3:2004) C: the second environment (IEC61800-3:2004) category C3 (EN 61800-3:2004)

C.3.2 Filter selection

Model	Input filter	Output filter
GD300-16-004G/5R5P-4	FLT-P04016L-B	FLT-L04016L-B
